The Plan

Hands-on materials

https://github.com/dcdace/fMRI_training

- fMRI files and data

- Pre-processing

- Statistical analysis

- Recap

File formats?
Organisation?
Content?

Hypothesis

Design an experiment

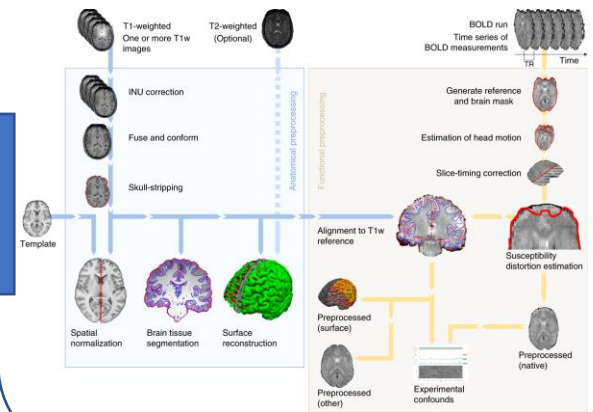

Stimuli
Timing

Collect the data

Anatomical image
Functional images
Event details

Pre-process & Analyse

The final push

File formats

Anatomical (T1w) image & Functional (T2*/BOLD) image

Collect the data

- **DICOM** - Digital Imaging and Communications in Medicine (.dcm)
 - Raw data standard for storing and communicating medical images
 - Contains a **header** (meta data) and the actual **image** itself
 - A separate file for each **slice** (2D format)

Why is
anatomical scan
collected only
once?

Need to convert to NifTI

functional scan
A brain image
(slice-by-slice)
selected every
2s > 100 times

- **NifTI** – Neuroimaging Informatics Technology Initiative (.nii, .nii.gz)
 - Standardised representation of brain images, cross-platform, cross-software
 - Contains **header** and **image**
 - 3D or 4D files (all slices/volumes in a single file)

Collect the data

Anatomical (T1w) image & Functional (T2*/BOLD) image

- T1w.nii
- bold.nii

Collect the data

Anatomical (T1w) image & Functional (T2*/BOLD) image

- sub-01_T1w.nii
- sub-01_bold.nii
- sub-02_T1w.nii
- sub-02_bold.nii
- ...
- sub-100_T1w.nii
- sub-100_bold.nii

Collect the data

Anatomical (T1w) image & Functional (T2*/BOLD) image

- sub-01_T1w.nii
- sub-01_run-01_bold.nii
- sub-01_run-02_bold.nii
- sub-02_T1w.nii
- sub-02_run-01_bold.nii
- sub-02_run-02_bold.nii
- ...
- sub-100_T1w.nii
- sub-100_run-01_bold.nii
- sub-100_run-02_bold.nii
- and even more files

How should we
organise our files?

File organisation

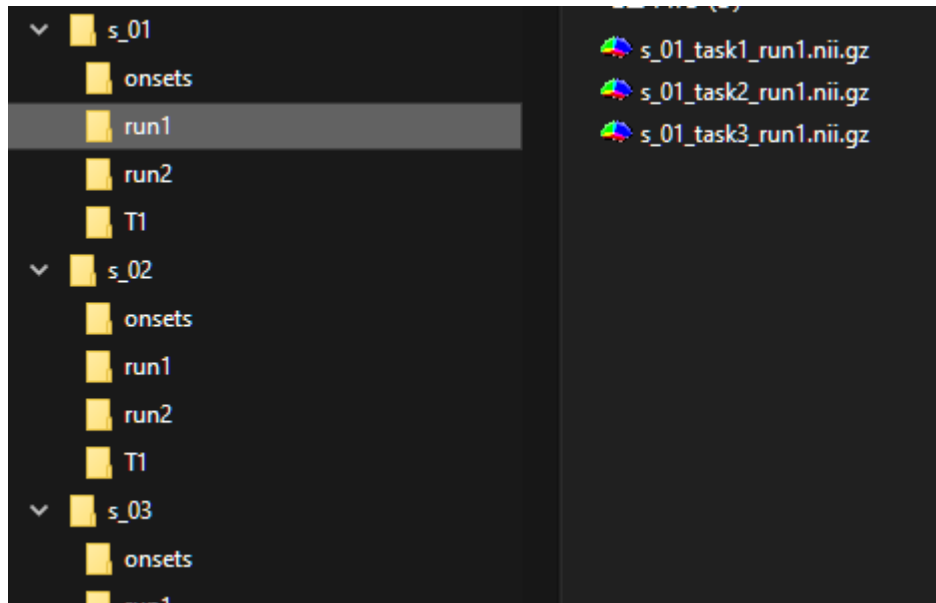

Data management

~~File organisation~~

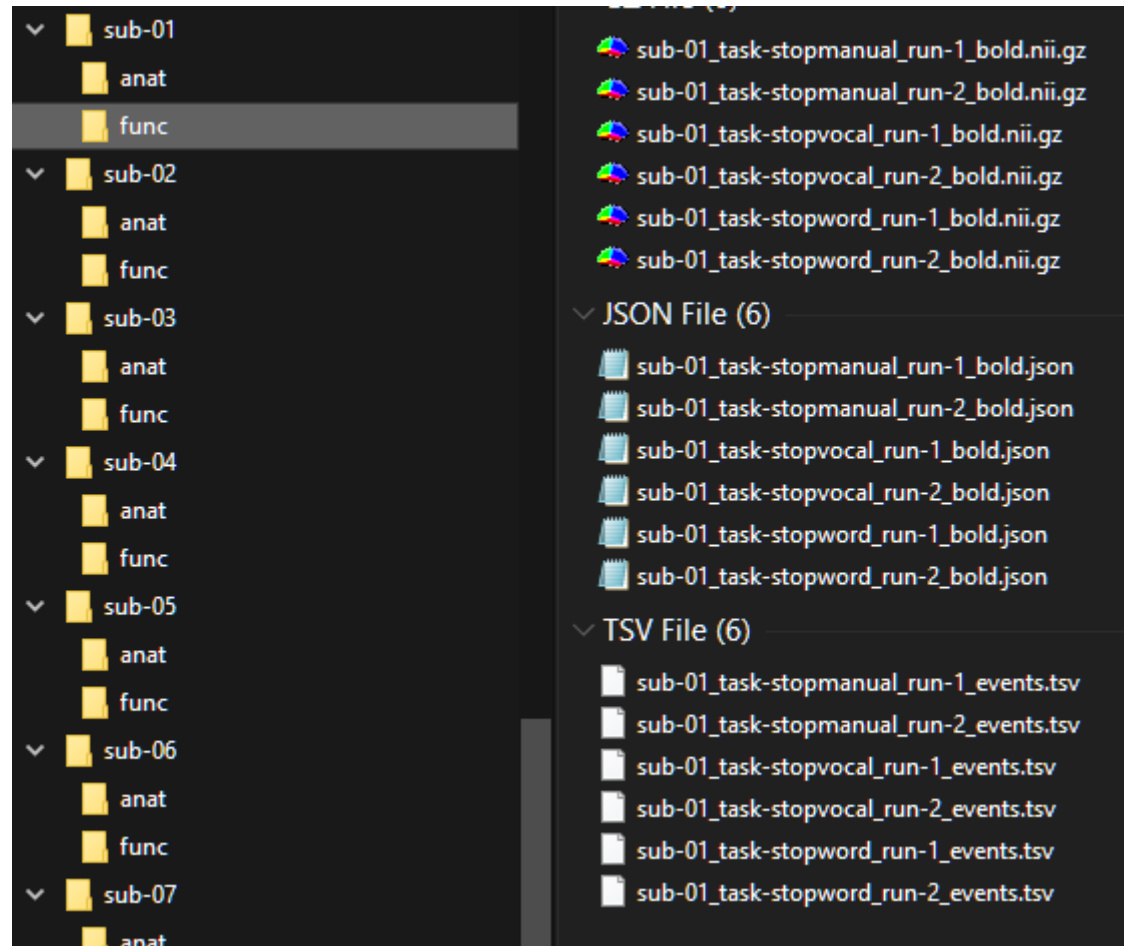

fMRI terminology

- **Session**
 - The time that the subject enters the scanner until they leave the scanner. This will usually include multiple scanning runs with different pulse sequences, including anatomical, functional, etc. Participant can be invited for a follow up session, next day or even later. That will then be Session 2.
- **Run**
 - A period of temporally continuous data acquisition using a single pulse sequence. Functional acquisitions are often split into multiple runs (5-10min) with brief breaks in between.
- **Volume**
 - A single 3D image acquired as part of a run. There is 1 anatomical volume and > 100 functional volumes.
- **Condition**
 - A set of task features that are created to engage a particular mental state. E.g., look at faces (condition 1), or look at houses (condition 2).
- **Trial**
 - A temporally isolated period during which a particular condition is presented, or a specific behaviour is observed. E.g., the first occurrence of the 'faces' condition is trial_1, the second occurrence is trial_2.
- **Event**
 - A trial can consist of multiple subunits. E.g., viewing faces trial may include pressing a button if you saw this face in the previous trials. Or working memory task may contain encoding, delay, retrieval. These subunits are labelled as 'events' and the 'trial' is defined as an overarching task.
- **Block (or an 'epoch')**
 - A temporarily contiguous period when a subject is presented with a particular condition.

Example 1

Example 2

- **Problems with heterogeneity in data management**

- Difficult for others (and you!) to understand your data and keep track of changes
- Scripts have to be adapted (can't be easily reused)
- Huge effort to automate workflows and no way to automatically validate data sets
- Sharing data becomes a hustle

Wouldn't it be much easier if everybody organised the files in the same way?

fMRI data management

- A standardised way for organising & describing neuroimaging data

Brain Imaging Data Structure - **BIDS**

- **Benefits of BIDS**

- Easy for other people to work on your data (for collaborations or contract changes)
- Growing number of data analysis software packages that understand BIDS
- Databases, such as OpenNeuro and LORIS etc., accept and export datasets organised according to BIDS
- Validation tools that can check your dataset integrity and let you easily spot missing values

BIDS

- Contains participant information

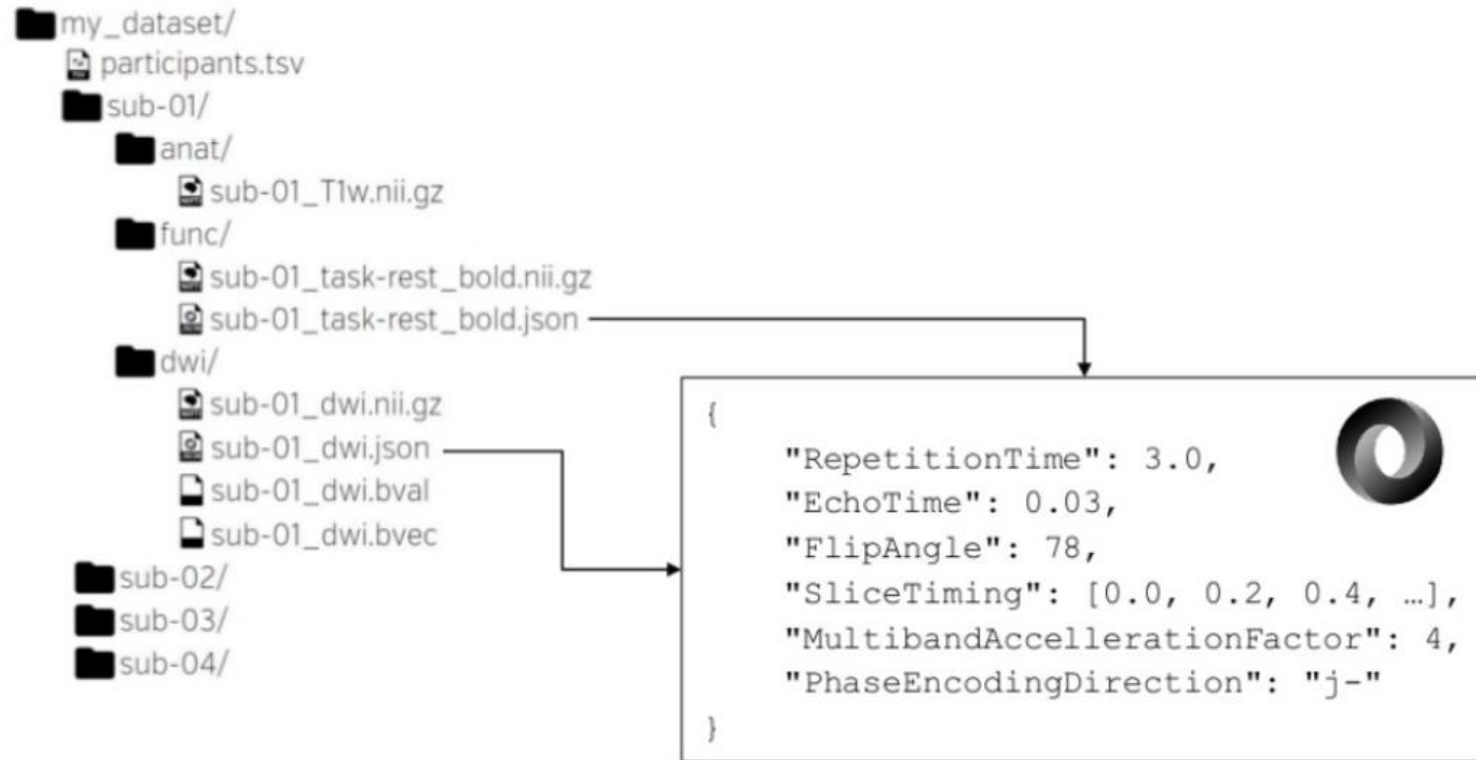

BIDS

- Contains data files: neuroimaging/behaviour

BIDS

- Contains study specific JSON files: sequences & paradigm

BIDS

Collect the data

Many BIDS converters available

PyBIDS

- Python library to centralise interactions with datasets conforming BIDS format
- Install via `pip install pybids`

```
from bids.grabbids import BIDSLayout  
layout = BIDSLayout("/ds0114/")
```

```
# Get number of subjects  
layout.get_subjects()  
  
>>> ['01', '02', '03', '04', '05', '06', '07', '08', '09', '10']
```

```
# Get specific files  
layout.get(subject='01', modality="anat", session="test")  
  
>>> [File(filename='/ds0114/sub-01/ses-test/anat/sub-01_ses-test_T1w.nii.gz',  
         subject='01', session='test', type='T1w', modality='anat'),  
      File(filename='/ds0114/sub-01/ses-test/anat/sub-01_ses-test_T1w_bet.nii.gz',  
         subject='01', session='test', type='bet', modality='anat')]
```

MRI data structure

Karolina Finc

MRI data

MRI data

What determines the resolution?

Why can't we acquire the functional images with higher resolution?

high resolution **MRI**

One 3D volume

fMRI low resolution

...
series of 3D volumes (i.e., 4D data)
(e.g., every 2 sec for 5 mins)

fMRI data

- Acquired in slices (usually axial; z-axis)

- Temporal resolution (TR) usually 1.5-3s
- Modern sequences allow acquiring multiple slices at the same time
- Typically 30-50 slices acquired
- More slices = longer TR

MRI data structure

Structural data

Functional data

1

2

...

T

Time series - is a series of data points listed in time order.

Every voxel has its own time-series.
